Length of Stay Efficiency	2.19	2.33	2.37
FIM Change	26.8	24.4	26.4
Admission FIM	67.5	64.3	60.8
Discharge FIM	94.3	88.7	87.2
% Discharged to Community	74%	75%	74%
% Discharged to Long-Term Care Facility	13%	8%	9%
% Discharged to Acute	10%	9%	10%
% Discharged to Other Rehab	3%	8%	7%

### Case Mix

Stroke	Brain	Neuro	Spinal Cord	Amputee	Pain	Ortho	Cardiac	Pulmonary	Debility
23%	15%	3%	6%	5%	1%	38%	3%	2%	5%

To measure a patient's progress during rehabilitation treatment, it is necessary to use a standard rating scale. The scale used most frequently is the Functional Independence Measurement (FIM). It measures the patient's level of independence in several areas, and the total score is used to measure patient outcomes. The FIM scale gives professionals an accurate way to communicate patient needs, set goals for treatment and measure gains made by the patient. Additionally, it helps the rehabilitation unit measure its success with all patients treated. This report card is to communicate the outcomes produced at Southwest General.
